

POLOLU ADJUSTABLE 4-12V STEP-UP/STEP-DOWN VOLTAGE REGULATOR S18V20ALV

/POLOLU ADJUSTABLE 9-30V STEP-UP/STEP-DOWN VOLTAGE REGULATOR S18V20AHV

## USER'S GUIDE

### CONNECTIONS

This step-up/step-down regulator has four connections: input voltage (VIN), ground (GND), and output voltage (VOUT), and ENABLE.

The input voltage, VIN, should be between 2.9 V and 32 V. Lower input voltages can cause the regulator to shut down or behave erratically; higher input voltages can destroy the regulator, so you should ensure that noise on the input is not excessive. 32 V should be treated as the absolute maximum input voltage. Our recommended maximum operating voltage is 30 V, which is the limit of the reverse voltage protection. Additionally, we recommend keeping the sum of the input and output voltages below 55 V; see the *Setting the Output Voltage* section below for more information.

The regulator is enabled by default: a 100 kΩ pull-up resistor on the board connects the ENABLE pin to reverse-protected VIN. The ENABLE pin can be driven low (under 0.7 V) to put the board into a low-power state. The quiescent current draw in this sleep mode is dominated by the current in the pull-up resistor from ENABLE to VIN and by

the reverse-voltage protection circuit, which will draw between 10  $\mu\text{A}$  and 20  $\mu\text{A}$  per volt on  $V_{\text{IN}}$  when ENABLE is held low (e.g. approximately 30  $\mu\text{A}$  with 3 V in and 500  $\mu\text{A}$  with 30 V in). If you do not need this feature, you should leave the ENABLE pin disconnected. Note that the SEPIC topology has an inherent capacitor from input to output; therefore, the output is not completely disconnected from the input even when the regulator is shut down.

Pololu adjustable step-up/step-down voltage regulator S18V20AHV with included optional terminal blocks and header pins.

Pololu adjustable step-up/step-down voltage regulator S18V20ALV, assembled with included terminal blocks.

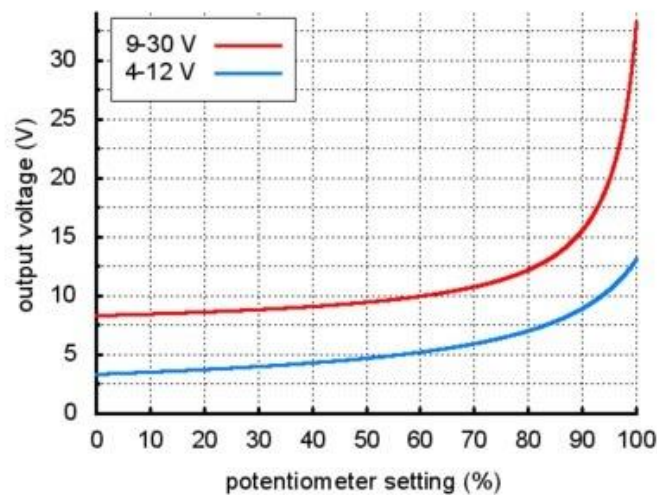

The connections are labeled on the back side of the PCB, and the board offers several options for making electrical connections. You can solder the included 2-pin 5mm-pitch terminal blocks to the two pairs of larger holes on the ends of the board. Alternatively, if you want to use this regulator with a solderless breadboard, 0.1"-pitch connectors, or other prototyping arrangements that use a 0.1" grid, you can solder pieces of the included 9x1 [straight male header strip](#) to the 0.1"-spaced smaller holes (each large through-hole has a corresponding pair of these smaller holes). For the most compact installation, you can solder wires directly to the board.

The board has four mounting holes intended for #2 or M2 screws. In applications where mounting screws are not used and wires are soldered directly to the board, the insulated part of the wires can be passed through the mounting holes for strain relief. The picture above shows an example of this with 20 AWG wire, which was close to the limit of what would fit through the mounting holes.

## SETTING THE OUTPUT VOLTAGE

The output voltage can be adjusted using a multimeter and a light load (e.g. a 10 k $\Omega$  to 100 k $\Omega$  resistor). Turning the potentiometer clockwise increases the output voltage. The output voltage can be affected by a screwdriver touching the potentiometer, so the output measurement should be done with nothing touching the potentiometer (also, note that touching parts of the board with your finger can affect the output voltage). The following graph shows the approximate output voltage as a function of the potentiometer position:

Output voltage settings for Pololu adjustable step-up/step-down voltage regulators S18V20ALV (blue line) and S18V20AHV (red line).

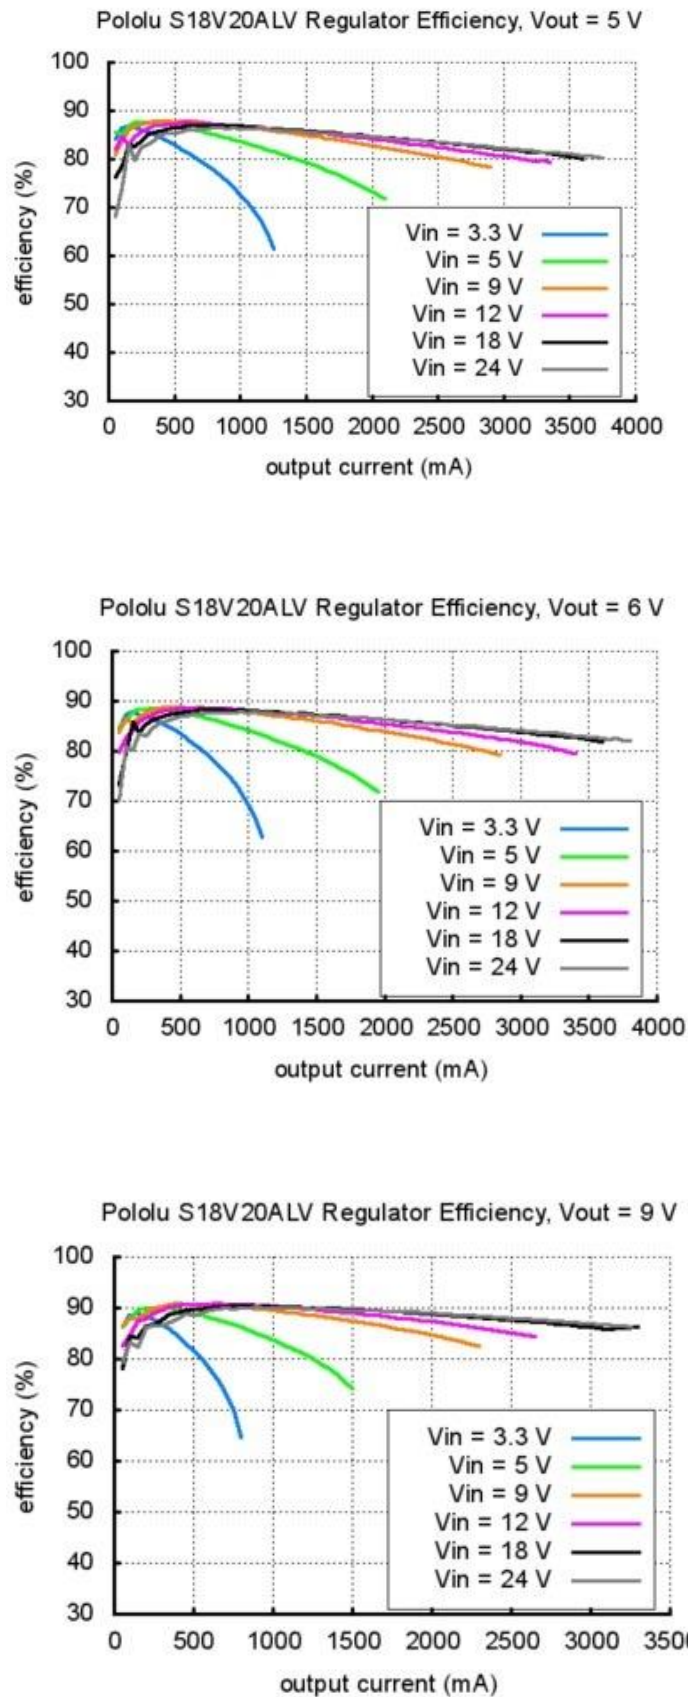

**Note:** We recommend against using this regulator in situations where the sum of the input and output voltages exceeds 55 V. For example, if your input voltage could reach 30 V, you should keep the output voltage setting under 25 V. It is typically not very practical to use the AHV version of this regulator beyond about 24 V out; our [U3V50AHV step-up voltage regulator](#) will usually be a more appropriate option for higher-output-voltage applications.

The trimmer potentiometer is not rated for continual adjustment back and forth; the intended application is to set the output voltage a few times in its life.

## TYPICAL EFFICIENCY AND OUTPUT CURRENT

The efficiency of a voltage regulator, defined as  $(\text{Power out})/(\text{Power in})$ , is an important measure of its performance, especially when battery life or heat are concerns. As shown in the graphs below, these switching regulators have an efficiency of 80% to 90% for most combinations of input voltage, output voltage, and load.

S18V20ALV (4-12 V) efficiencies for various combinations of VIN and VOUT:

S18V20AHV (9-30 V) efficiencies for various combinations of VIN and VOUT:

We manufacture these boards in-house at our Las Vegas facility, which gives us the flexibility to make batches of regulators with customized components to better meet the needs of your project. For example, if you have an application where the input voltage will always be below 20 V and efficiency is very important, we can make these regulators a bit more efficient at high loads by replacing the 30V reverse voltage protection MOSFET with a 20V one. We can also customize the set output voltage. If you are interested in customization and want at least a few dozen units, please contact us.

The maximum achievable output current of the board varies with the input voltage but also depends on other factors, including the ambient temperature, air flow, and heat sinking. The graphs below show output currents at which this voltage regulator's over-temperature protection typically kicks in after a few seconds. These currents represent

the limit of the regulator's capability and cannot be sustained for long periods, so the continuous currents that the regulator can provide are typically several hundred milliamps lower.

During normal operation, this product can get hot enough to burn you. Take care when handling this product or other components connected to it.
